10. The method of claim 9, wherein the identified genotype of the individual comprises the nucleotide pair at each of PS1-PS19, which have the position and alternative alleles shown in SEQ ID NO:1.

11. A method for identifying an association between a trait and at least one haplotype or haplotype

5 pair of the tumor necrosis factor receptor superfamily, member 11b (osteoprotegerin)
 (TNFRSF11B) gene which comprises comparing the frequency of the haplotype or haplotype
 pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in
 a reference population, wherein the haplotype is selected from haplotypes 1-22 shown in the
 table presented immediately below, wherein each of the haplotypes comprises a sequence of
 10 polymorphisms whose positions and identities are set forth in the table immediately below:
